

Supplemental Figure 1. IL-10 alters DC phenotype even at 100-fold lower cytokine concentrations. The line graphs depict the mean+SEM fluorescence intensity of DC phenotypic markers following treatment with IL-10 at 40ng/ml, 4ng/ml, and 0.4ng/ml on immature DCs (black) or mature DCs (grey line). Statistically significant differences are also indicated in black for immature DCs or grey for mature DCs.
