

SUPPLEMENTARY FIGURES

Figure S1: Efficient transduction of human adult islets with SV40LT expressing lentiviral vector

Human adult islets preparations were partially dissociated, transduced with an SV40LT-expressing lentiviral vector and analyzed one week after transduction. Many insulin (INS)-positive cells (red) co-stained for SV40LT (green). Nuclei were stained with Hoechst 33342 fluorescent stain (blue). Scale bar: 200 μm

Figure S2: Beta cell composition of a human adult islet preparation

A fraction of the human islet preparation that was used for real time PCR was analyzed by immunohistochemistry in order to evaluate the relative size of the beta cell population in a human islet preparation. Insulin (INS)-positive cells (red) constituted approximately 40% of the total cell number, as measured by nuclei staining with Hoechst 33342 fluorescent stain (blue). Scale bar: 300 μm

Figure S3: Immunofluorescence analysis of EndoC- β H1 cells.

EndoC- β H1 cells stained negative for glucagon (GCG), amylase (AMYL) and SOX9. Cells that co-expressed INS and somatostatin (SST) were rarely seen. Scale bar: 25 μm
